PROFESSIONAL SUMMARY

Technical writer and software developer with independent B2B technology articles, practical documentation samples, and project experience across React interfaces, Python/FastAPI services, REST APIs, and database-backed workflows. Comfortable tracing a feature from its user-facing behavior through API requests and data handling, then explaining the relevant setup, behavior, and limitations clearly. Continues to build experience through independent work, team projects, and technical learning.

Professional focus: software development, frontend and backend engineering, API integration, databases, and collaborative project work.

TECHNICAL WRITING

Independent B2B technology articles and self-directed documentation samples, not commissioned client work.

Documentation and tutorial samples: View
Technical articles: View

TECHNICAL EXPERIENCE & PROJECT WORK

Independent Technical Writing

Technical Writer | B2B Technology Articles and Documentation Samples | Independent portfolio work; dates not specified

Writes independent explainers and practical documentation samples alongside software development projects. The work is self-directed and is not presented as commissioned client work.

- Authored six portfolio articles covering SaaS, cloud computing, APIs, cybersecurity, artificial intelligence, and blockchain.
- Prepared an illustrative REST API reference, developer tutorials, and software documentation examples for this portfolio.
- Uses source material, structured explanations, examples, and explicit scope notes to make technical topics understandable without overstating implementation.

Independent Software Projects

Software Developer | Independent projects; dates not specified

Builds and maintains browser-based products and full-stack application prototypes, with project scope and status documented in the portfolio catalogue.

- Develops independent frontend and full-stack projects using React, JavaScript, Python, and FastAPI.
- Builds database-backed task and commerce workflows in independent and collaborative projects.
- Maintains this React and Vite portfolio with technical articles, project information, and contact functionality.

HNG Internship 15 — Team Zedu-Puffin

Backend / Full-Stack Development Intern | Dates not specified

Contributed within a team to a task-manager project connecting a React and Vite frontend to a Python and FastAPI backend.

- Contributed within a team project with task creation, retrieval, updating, deletion, and task-status workflows.
- Worked on a product whose documentation describes a React/Vite frontend, a Python/FastAPI REST API, and SQLite persistence.
- The repository describes the overall team product and does not attribute individual feature ownership to specific contributors.

TS Academy

Student Moderator — Frontend Development Programme | Dates not specified

Supported learners participating in a frontend development programme.

- Helped students set up development environments and use VS Code, CodePen, and GitHub workflows.
- Provided peer guidance as members worked through frontend learning activities.

INDEPENDENTLY BUILT PRODUCTS

Noir Scents

Full-Stack E-commerce Application | Live frontend and backend health checks respond.

A full-stack perfume storefront for browsing products, maintaining inventory, creating orders, and completing online payment. Its React storefront communicates with a FastAPI service backed by PostgreSQL.

Purpose: Bring product discovery, stock control, customer checkout, and order administration into one e-commerce application.

Problem / context: A single storefront and service are needed to connect product browsing, stock tracking, customer orders, and online payment.

Role & contribution: Independently developed and maintained in the owner's public GitHub repository.

Ownership: Independent project — owner-maintained repository

Technology: React, Vite, Python, FastAPI, PostgreSQL, SQLAlchemy, Google Identity Services, JWT sessions, Paystack API, Mailgun

- Product catalogue and inventory management; order creation and management through the API.
- Paystack payment initialization and server-side transaction verification. Creating an order reserves stock; failed or abandoned Paystack payments restore the reserved stock.
- Google sign-in backed by server-side identity-token verification and a seven-day application session.
- Mailgun welcome messages and order confirmations after verified payment; delivery depends on valid server-side Mailgun configuration.

Project notes: Customer account, checkout, Paystack transaction, stock restoration, and email flows were not end-to-end tested in the deployed environment. Paystack is the only online provider documented as implemented. Flutterwave and OPay are pending integrations; bank transfer is pending/manual. Do not present them as operational payment methods.

Backend Health: Open

Coveilla Scents

Fragrance Commerce Application | Scope described; implementation details not independently verified.

A fragrance storefront described as a React frontend connected to a Python/FastAPI service and a PostgreSQL database hosted on Neon. Product management is part of the supplied project scope; detailed implementation status has not been reviewed against a source repository.

Purpose: Present fragrance products to customers and support a database-backed product management workflow.

Role & contribution: Project owner. The technology stack and product management scope are based on the supplied project description; repository and deployment links were not included in the portfolio data.

Ownership: Owner-described project; source and deployment links not supplied.

Technology: React, Python, FastAPI, PostgreSQL, Neon

Project notes: Review the source and add live/repository links before describing specific completed product-management features.

Coveilla Blog

Full-Stack Blogging and Content Platform | Live frontend; sign-in screen shown during review.

A reader and administrator platform for browsing and publishing articles, with account access, contact messaging, and newsletter subscriptions.

Purpose: Give readers access to blog content while providing protected workflows for article management, contact submissions, and newsletter subscriptions.

Problem / context: Readers need a place to access articles while administrators need protected tools to manage content and submissions.

Role & contribution: Independently built repository; package metadata names Godscovenant Patrick Udofe as author.

Ownership: Independent project — repository author verified in package metadata

Technology: React 19, Vite, React Router, Three.js, Node.js, Express 5, Sequelize, Neon PostgreSQL, JWT, Google authentication, bcryptjs

- Reader registration and sign-in with password and Google authentication; administrator sign-in is separate and role-protected.

- Article list and individual article retrieval; administrator-only create, edit, and delete routes.
- Contact submissions are stored and sent through the configured email utility; administrators can review and delete stored messages.
- Newsletter subscription, welcome/owner notifications, password-reset messaging, and login notifications are implemented in the repository. Actual delivery depends on deployment email and API configuration.

Project notes: The README does not identify a deployed backend API URL. Production reader/admin, database, publishing, and email flows could not be verified in the deployed environment.

Ziki Redesign

Human-Controlled Collaborative Workspace Prototype | Live interactive frontend prototype; local simulations.

A browser-based collaboration workspace that helps contributors explore issue opportunities, shape reviewable plans, and keep approval decisions with a person. The seven-agent crew and workflow are local simulations rather than connected AI or repository services.

Purpose: Demonstrate a human-controlled multi-agent work process with explicit planning, permissions, review, revision, and approval stages.

Problem / context: Demonstrates how a contributor workspace could organize opportunities, plans, permissions, and human review. The source does not document a specific prior interface problem.

Role & contribution: Built the frontend prototype and its local workflow simulation in the public repository under Godscovenant Udofe's account.

Ownership: Independent frontend prototype — personal public repository

Technology: HTML, CSS, Vanilla JavaScript ES modules, Browser localStorage, Vercel

- Seven specialist robot personas, task creation and queues, agent conversations, and local draft preparation.
- Illustrative issue recommendations, plan details, scope, assumptions, risks, dependencies, time estimates, and requested permissions.
- Human review actions: approve a displayed plan, reject it, or request a revision; simulated work status and activity history persist in browser localStorage.
- Responsive workspace navigation and reduced-motion handling.

Project notes: Issue examples and agent responses are local demo fixtures/templates. The deployment does not document a specific prior interface problem addressed by the redesign. This project is separate from the owner's Ziki PR #624, which adds automated end-to-end tests to the existing Ziki product.

TEAM AND INTERNSHIP PROJECTS

HNG Stage 1 Task Manager

Full-Stack Team Project | Team project; frontend and API documentation are reachable.

A team-built task manager from HNG Internship 15, developed by HNG Tech — Team Zedu-Puffin, with a React/Vite interface and a Python/FastAPI REST API backed by SQLite.

Purpose: Help users organize dated tasks and follow their progress through a calendar and task list.

Problem / context: Users need a way to organize dated tasks and follow progress across a calendar and task list.

Role & contribution: Team contributor. The repository documents the overall project but does not attribute individual feature ownership to specific contributors.

Ownership: HNG Internship 15 — team project — Team Zedu-Puffin

Technology: React, Vite, Python, FastAPI, REST API, SQLite, PostgreSQL exploration

- Create, retrieve, edit, delete, and complete tasks with descriptions, dates, and in-progress/completed statuses.
- Monthly calendar and task timeline with progress indicators.
- Persistent task records stored in SQLite; the project brief documents PostgreSQL exploration.

Project notes: The backend root and /health returned 404 during the check, while /docs and /openapi.json returned 200. Individual task API workflows were not end-to-end tested. The README describes team-wide functionality and does not attribute individual endpoint or UI ownership to specific contributors.

Start.ng — Whimsical Creator Companion

Team Product Contribution — Frontend Interaction | Live HNG community platform; contribution verified in source branch.

A contribution to start.ng, a community platform for discovering and playing free browser games, publishing community-created games, and visiting games at individual addresses. The live site identifies itself as built by the HNG community.

Purpose: Add a friendly creator-focused interaction to a larger browser-gaming platform and invite visitors to submit a game.

Problem / context: A large gaming community platform benefits from a welcoming creator interaction that helps visitors discover how to submit a game.

Role & contribution: Implemented the creator robot companion and lamp-and-flower profile interaction in a task-specific source branch. The robot has idle reactions and a prompt with a “Create a game” action; commits also add the companion to public homepage visitors.

Ownership: Team contribution — platform identifies as an HNG community product; task-specific commits are in the owner’s public branch.

Technology: React 18, TypeScript, Vite, CSS, Google OAuth integration

- Whimsical SVG robot companion with idle animation, pointer-aware gaze, introductory prompt, and a create-game action.
- Lamp-and-flower profile interaction and creator-page behavior.
- The wider platform supports game discovery, browser play, game submission, and community features; those platform-wide capabilities are not presented as the owner’s individual work.

Zedu Desktop

Team Software Project — Flutter Desktop Application | Team repository available; no separate live application deployment was verified.

A team-developed Flutter application organized with Clean Architecture. Its documented reference vertical slice covers authentication, session state, and API wiring, with desktop and mobile targets.

Purpose: Provide a cross-platform team communication application with shared infrastructure and an authentication/session flow.

Problem / context: The team project addresses cross-platform communication and account/session workflows; the repository-level scope is distinct from the owner’s individual pull requests.

Role & contribution: Team repository contributor. My verified code changes are listed separately under Open-Source Contributions; the broader application is not represented as independent work.

Ownership: Team project — repository forked from the Zedu project

Technology: Flutter, Dart, Clean Architecture, Material 3, Riverpod, GetIt, GoRouter, Dio, Secure Storage, Mocktail

- Repository structure separates presentation, domain, and data layers.
- Authentication/session reference flow uses Riverpod, repository abstractions, remote API access, and secure storage.
- Repository includes unit and widget tests and documents Windows desktop MSIX packaging.

Project notes: These are repository-level capabilities. They are not claims that the portfolio owner authored the entire application.

PORTFOLIO PROJECTS

Portfolio Website

Personal Portfolio — React Web Application | Current portfolio project

A responsive technical portfolio featuring software projects, engineering contributions, technical articles, and contact information.

Purpose: Present verified software projects, technical learning, contributions, and articles in a single professional portfolio.

Problem / context: Technical project work, contributions, and articles need a responsive public portfolio with clear project details and contact paths.

Role & contribution: Built and maintain this portfolio website.

Ownership: Personal project

Technology: React, Vite, JavaScript, Tailwind CSS v4, React Router, CSS

- Six long-form B2B technology articles with original SVG technical diagrams.
- Responsive layouts, category filters, search, article routes, and project detail cards.
- Rule-based portfolio assistant with curated answers; it does not use a live generative AI service.
- Contact form validates input and opens a prefilled mailto draft; the website does not send messages directly.
- Resume page and downloadable PDF.

PROFESSIONAL CONTRIBUTIONS

Ziki PR #624 — Marketing lifecycle Playwright coverage

Emerjent / Ziki | Open pull request — not merged as of this audit

Purpose: Add browser-level regression coverage for the Ziki marketing task lifecycle.

Problem / context: The multi-step marketing task lifecycle needs automated coverage across proposal, issue creation, bidding, delivery, review, publication, and points persistence.

Role: Authored the Playwright end-to-end test in an open pull request; it is not represented as merged.

Technology: Playwright

Added browser-level Playwright coverage for proposing a Marketing task with rationale and type, reaching three positive verdicts, creating an issue, bidding and awarding work, accepting the offer, delivering content without a pull request, reviewing and publishing it, and checking persisted participant points and idempotency.

Pull request: Open

Contribution note: The PR says its end-to-end test was not run locally and expects CI to run the project checks. This is a test contribution to the existing Ziki product, separate from Ziki Redesign.

Zedu Desktop PR #27 — Profile settings crash fix

Zedu-Vulcan / Zedu Desktop | Merged — October 18, 2026

Purpose: Prevent a profile-settings provider crash on desktop.

Problem / context: The reported profile-settings provider failure could crash the desktop application.

Role: Submitted the fix in a merged team-repository pull request.

Technology: Flutter, Dart

Fix for a profile-settings provider crash on desktop.

Pull request: Open

Zedu Desktop PR #71 — Empty-channel invite action

Zedu-Vulcan / Zedu Desktop | Open pull request — not merged as of this audit

Purpose: Give users an actionable next step when a channel has no members.

Problem / context: An empty channel state needs an invitation action to guide users toward adding participants.

Role: Proposed an empty-channel invite action in an open pull request.

Technology: Flutter, Dart

Proposes an actionable invite call-to-action for the empty-channel state. The change remains an open proposal.

Pull request: Open

Zedu Desktop PR #73 — Web SEO metadata

Zedu-Vulcan / Zedu Desktop | Open pull request — not merged as of this audit

Purpose: Improve browser-facing metadata for search and social sharing.

Problem / context: Web pages need canonical, indexing, and social preview metadata for consistent discovery and sharing.

Role: Proposed web SEO metadata updates in an open pull request.

Technology: HTML, Web metadata, Web manifest

Proposes canonical and robots metadata, Open Graph and Twitter card metadata, and updates to the page title, application display name, and web manifest.

Pull request: Open

ADDITIONAL DEVELOPMENT PROJECTS

Basic Calculator

Frontend Development | Individual frontend project — repository README credits Godscovenant Patrick Udofe.

An interactive browser calculator for basic arithmetic, with keyboard controls, live input, clear/reset behavior, and responsive layout.

Purpose: An interactive browser calculator for basic arithmetic, with keyboard controls, live input, clear/reset behavior, and responsive layout.

Problem / context: Users need a lightweight browser tool for basic arithmetic.

Role: Independently developed frontend project; see the linked repository for the documented implementation.

Technology: HTML5, CSS3, Vanilla JavaScript

- Addition, subtraction, multiplication, and division.
- Keyboard support for numbers, operators, Enter, Backspace, and Escape.
- Clear/reset and real-time input display.

View Live Project: Open

GitHub Repository: Open

Image Gallery

Frontend Development | Individual frontend project — repository README credits Godscovenant Patrick Udofe.

A responsive gallery for browsing a collection of images, opening previews, and navigating between images.

Purpose: A responsive gallery for browsing a collection of images, opening previews, and navigating between images.

Problem / context: Visitors need to browse images, filter categories, and inspect images without leaving the gallery.

Role: Independently developed frontend project; see the linked repository for the documented implementation.

Technology: HTML5, CSS3, JavaScript ES6

- Responsive image grid with category groupings.
- Image preview and next/previous navigation for expanded viewing.

View Live Project: Open

GitHub Repository: Open

Todo Card Stage 1a

Frontend Development | Individual frontend project — public repository and live demo supplied by owner.

A single-card task manager demonstrating accessible editing, task status, priority, due-date countdowns, and expandable descriptions.

Purpose: A single-card task manager demonstrating accessible editing, task status, priority, due-date countdowns, and expandable descriptions.

Problem / context: A compact task card needs editable task details, visible status and priority, and a due-date indicator.

Role: Independently developed frontend project; see the linked repository for the documented implementation.

Technology: HTML, CSS, Vanilla JavaScript

- Edit title, description, priority, and due date; save or cancel changes.
- Synchronize pending, in-progress, and done states across the checkbox, select, and visible status.
- Expand/collapse details accessibly and update a due-date countdown.
- Single-card demo; the README notes it has no backend or persistence across refreshes.

SKILLS

Programming

Python, JavaScript, HTML5, CSS3

Used in independent and collaborative project work

Frameworks and Libraries

React, Vite, FastAPI, Node.js, Express.js

Project experience documented in the portfolio catalogue

Backend and APIs

REST APIs, API integration, CRUD workflows, Postman

Used in independent and team project work

Databases

SQLite, PostgreSQL, Neon

Project use documented in independent and team projects

Developer Tools

Git, GitHub, VS Code, Vercel, Render

Used across project development and deployment workflows

Technical Communication

B2B technology writing, API documentation samples, Developer tutorials, Software documentation, README writing, Technical research, Proofreading and editing

Independent portfolio articles and documentation samples

Technical Foundations

Cybersecurity fundamentals, Blockchain concepts, Artificial intelligence concepts

Learning interests; not presented as professional specialization
